

Recommended User Permissions

After installation of the DWS Server data directories and files, the System or Network Administrator must assign the necessary permission levels for DWS application users.

For Networked/Multiple User Installations

If the DWS server directory (**DWSERVER.K10**) resides on a network then all users of this application must be given **Full Access** or **Full Control** to this directory as the software will read, write, modify, delete, and execute to and from this folder.

Users must also be granted, at minimum, **Power User (Standard User)** access privileges on their local PCs, as the Client portion of the software will reside on the local hard disk in a folder named **ERASDW.K10** and must be read and written to.

Requirements for Windows 2000, and XP

When installing the DWS on Windows 2000 and XP systems, users will need **Administrator level** permission. Other permission levels such as Guest or Power User will not grant proper access to the various directories, files or functions needed to operate the ERAS software. It is important that the user be able to write to the various directories throughout the process.

For Local/Single User Installation

If the DWS server components are installed on a local workstation hard drive, users must be granted, at minimum, **Power User (Standard User)** access privileges on their local PCs, as both the client (**ERASDW.K10**) and server (**DWSERVER.K10**) portion of the software will reside on the local hard drive and must be read and written to.

Requirements for Windows 2000, and XP

When installing DWS on Windows 2000 and XP systems, users will need **Administrator level** permission. Other user permission levels such as Guest or Power User will not grant proper access to the various directories, files or functions needed to operate the ERAS software. It is important that the user be able to write to the various directories throughout the process.
