Causality
Choice is good—expand its boundary. What, from a macro level, does success look like?

Urban universities for health: an effort to develop metrics & best practices that will build a right-sized team-based health workforce that will increase access, increase quality, reduce disparities, and improve health in the urban communities throughout the US. We will do this through dissemination of metrics & best practices & by helping urban institutions learn how to use them.

Joint collaborative effort to learn along the way... build bridges as we walk across... use interim markers... start earlier in pipeline... capitalize on change in higher ed. & health-political environment.

Our goal is to promote health equity and reduce health disparities through collaboration among public urban universities by developing & sharing tools and resources to identify effective strategies to prepare a diverse and culturally competent workforce.

Urban universities for health are committed to improving health outcomes for all communities by helping participants be a better tool to engage the vast communities they serve by ensuring that all health professionals are equipped to provide caring, high-quality services and improve the health of their community. To achieve these goals, we must see structural diversity across the institutions.

We will collaborate with our communities to develop consistent metrics to inform sustainable strategies as we create a diverse, culturally competent & qualified health workforce to improve health outcomes.

How do we design this?

We will challenge the status quo by developing methods to inform the development of a workforce that is in harmony with urban communities through the synergistic efforts of the learning collaborative.
