## 2017 AAMC Matriculating Student Questionnaire All Schools Summary Report \& Individual School Report

## Executive Summary

## Background

The Matriculating Student Questionnaire (MSQ) is administered annually by the Association of American Medical Colleges (AAMC) and collects information about entering medical students for the purpose of helping U.S. LCME-accredited medical schools improve medical education. The MSQ reports serve as benchmarking tools, and feedback from the MSQ helps medical schools plan their educational programs to fit the needs of their students. The All Schools Summary Report presents national data from the 2017 MSQ and includes national data from the 2015 and 2016 MSQs for comparison purposes, where comparison data are available. Some counts may change slightly from previous MSQ reports due to updates made to the MSQ data file. Copies of the All Schools Summary Report and the survey tool are publicly available on the AAMC website at www.aamc.org/data/msq.

In addition to receiving the All Schools Summary Report, each medical school is separately issued its own MSQ school report, which displays data for the medical school as well as the national data. By request, regional campuses and programs that offer specialized medical training under the aegis of an accredited institution are also issued MSQ campus reports if there are five or more student respondents from that campus or program. Campus reports are produced for each of the requested campuses and display data for the campus as well as data for the parent medical school (which includes data for all campuses combined). School and campus reports are made available to schools' authorized Student Surveys contacts, who have access via the AAMC Medical School Profile System (MSPS) web application at https://services.aamc.org/mspsreports. New requests for campus-level MSQ reports can be directed to msq@aamc.org.

## Methodology

The 2017 MSQ was open from June 1 through September 15, 2017. There were 21,996 individuals invited to participate via email in the 2017 MSQ online survey. These individuals were accepted for 2017 admission to any of the 147 U.S. LCME-accredited medical schools that enrolled students in 2017, including two new institutions enrolling students for the first time in 2017 (University of Nevada Las Vegas, School of Medicine and Washington State University Elson S. Floyd College of Medicine).

The 2017 MSQ All Schools Summary Report includes responses from 13,868 individuals who consented to participate in the survey. Of these, 13,852 were ultimately 2017 matriculants (representing 64.9 percent of the 21,338 matriculants in 2017). The additional 16 respondents had effective matriculation dates prior to 2017, or were second-time enrollees who were asked by their medical schools to complete the 2017 MSQ. Excluded from the report are the 124 survey respondents who participated in the MSQ but did not matriculate to medical school in the 2017-2018 academic year. Survey data for participating individuals may not be comparable to data for non-participants. Comparing response rates among the 147 schools with matriculating students in 2017, there were two medical schools achieving a 100 percent response rate among its matriculants; 24 medical schools with response rates between 90 percent and 99 percent; 43 medical schools with response rates between 70 percent and 89 percent; 42 medical schools with response rates between 50 percent and 69 percent; 28 medical schools with response rates between 25 percent and 49 percent; and eight medical schools with a response rate below 25 percent. Through a variety of measures, medical schools independently encouraged matriculating students to participate in the MSQ. The AAMC also sent notifications to these same students.

The MSQ includes questions used to better understand the lifestyles and personal characteristics of entering medical students. Some of these questions measure items such as tolerance for ambiguity, empathic concern, quality of life,
and perceived stress. The scales included in the MSQ were chosen because prior research has shown how the corresponding measures impact medical education and medical care. Descriptions of each scale are provided within the All Schools Summary Report, since the number of items in each scale, and the way the scales are calculated, differ. A reliability estimate (Cronbach's alpha) is also provided as a measure of internal consistency, where applicable.

Percentages displayed in the report may not sum to 100 due to rounding or to questions permitting more than one response. All percentages are rounded. As a result, a percentage of " 0.0 " does not necessarily indicate that no student responded to that survey option.

## MSQ Content Changes

The MSQ continues to evolve as part of ongoing efforts to re-engineer and align the AAMC Student Surveys. For example, extensive changes were made to the content of the MSQ in 2013. In addition, minor changes were made to the MSQ in 2015, 2016, and 2017. For new survey items, comparisons to prior years cannot be made. Blank rows and columns indicate that comparable data are not available.

Only one change was made to the 2017 MSQ. The question asking participants to provide an estimate of the current average salary for the specialty of interest was removed.

## Selected Findings

The selected findings below reflect key items about matriculants that have been of interest to members of the academic medicine community; however, readers may also wish to examine the other items about matriculants that the tables in the report contain.

## Financial Consideration Findings are Consistent from 2015 to 2017, with 35 Percent of Matriculants Reporting

 Educational Debt.In 2017, 35.3 percent of MSQ participants entered medical school already carrying educational debt. This represents similar findings from 2015 ( 35.8 percent) and 2016 ( 35.7 percent). For those carrying educational debt, the median total debt in 2017 remained the same as reported in 2016, $\$ 27,000$. The median parental income reported in 2017 by new medical students also remained steady at \$125,000.

## The Age of MSQ Participants at Matriculation Continues to Rise.

The percentage of respondents aged 23 to 25 increased to 48.7 percent in 2017 (up from 46.4 percent in 2015 and 46.9 percent in 2016), and respondents aged 20 to 22 upon matriculation dropped from 35.7 percent in 2016 to 34.5 percent in 2017. Similarly, well over half ( 62.6 percent) of new matriculants reported that more than a year had passed since graduating from college (up from 59.9 in 2015 and 60.6 in 2016).

Over One-third of Matriculants are Interested in Primary Care Specialties and Subspecialties.
In 2017, 35.3 percent of new medical students indicated plans to enter Family Medicine, Internal Medicine, Internal Medicine/Pediatrics, Obstetrics and Gynecology, or Pediatrics specialties or subspecialties. Of those who indicated an interest in those specialty areas, 48.3 percent are considering a career in a subspecialty, 27.5 percent are considering a career in primary care practice, 6.1 percent are considering a career as a hospitalist, and 18.0 percent are undecided.

## Matriculants are Interested in Working in Patient Care While Still Considering Work/Life Balance.

Almost all 2017 MSQ participants ( 98.3 percent) indicated plans to participate in patient care during their career. Of those respondents, 17.7 percent anticipate working in patient care on a part-time basis (less than 36 hours a week). Over three-fifths ( 62.2 percent) of MSQ participants indicated plans to participate in research during their career. Only 1.8 percent of 2017 MSQ participants who indicated plans to participate in research during their career expect to be involved in research on a full-time basis. Of those participants, 41.1 percent expect to be "significantly involved" in research.

When asked to think about career paths after medical school, "work/life balance" (47.0 percent), having a "stable, secure future" ( 41.9 percent), and the "ability to pay off debt" ( 41.4 percent) were most frequently cited as "essential" considerations. The career consideration that was most frequently reported as "not important" to new medical students was "social recognition or status" (37.9 percent).

## The Median Number of Secondary/Supplemental Applications Rose to 15 Applications in 2017.

In 2017, the median number of secondary/supplemental applications completed rose from 14 applications in 2016 to 15 applications in 2017 . Furthermore, nearly 18 percent ( 17.5 percent) of MSQ respondents indicated submitting 25 or more secondary/supplemental applications. When asked, in total, how much was spent on secondary/supplemental applications, the median cost reported by MSQ participants was $\$ 1,100$. The median number of interviews offered was four, while the median number of interviews attended by MSQ respondents was three interviews. The median cost reported for attending those interviews rose to $\$ 700$ in 2017 . Additionally, over 20 percent (23.2 percent) of MSQ respondents reported spending $\$ 2,000$ or more on interviews during the medical school application process.

## Medical School Matriculants Self-Report their Gender Identity and Sexual Orientation.

The percentage of those reporting a different gender identity from their sex assigned at birth in 2017 was 0.6 percent. MSQ participants were also asked to self-identify their sexual orientation. In 2017, 7.8 percent reported being "Bisexual" or "Gay or lesbian," compared with 6.9 percent reported in 2016 and 6.3 percent reported in 2015.

## Providing Feedback

We encourage constituents to provide feedback regarding the MSQ reports. If you would like to provide feedback, please contact msq@aamc.org, or Lindsay Roskovensky, Senior Research and Data Analyst, Data Operations and Services (Iroskovensky@aamc.org).

# Total number of students who responded to the questionnaire: <br> 1. Sex: <br> Note: This information is populated from other AAMC data sources (e.g., AMCAS). 

|  | Percent | $\frac{\text { Percent }}{}$ | $\frac{\text { Percent }}{}$ |
| :--- | ---: | ---: | ---: |
| Male | 50.2 | 48.1 | 47.2 |

Personal Characteristics - The following scales are used to help member medical schools learn about the lifestyles and personal characteristics of entering medical students. Descriptions of each scale are provided, as the number of items in each scale and the way the scales are calculated differ.

## 18. Tolerance for Ambiguity (TFA) Scale

Tolerance for Ambiguity (TFA) is a measure of one's ability to cope with situations of uncertainty. Scales measuring TFA have been used in prior research to show how ambiguity impacts medical education and medical care. TFA scores are calculated by summing across 7 items, which are measured on a 1-6 point scale. The possible range of scores is 7 to 42 , and higher scores are correlated with higher tolerance for ambiguity. Only participants who responded to every item on the scale are included in the summary statistics. The mean TFA score, the standard deviation, and the number of respondents are displayed below. Additionally, a reliability estimate (Cronbach's alpha) is shown as a measure of internal consistency. The measure varies from 0 to 1 , and an instrument is often considered to be reliable if the estimate is 0.7 or higher.

| Tolerance for Ambiguity (TFA) Scale | Reliability | Standard <br> Estimate |  |  | Mean <br> Deviation |
| :--- | :---: | :---: | :---: | :---: | :---: |
| All Medical Schools | 2017 | 0.7 | 25.1 | 5.7 | 12,793 |
| All Medical Schools | 2016 | 0.8 | 25.1 | 5.7 | 12,276 |
| All Medical Schools | 2015 | 0.8 | 25.0 | 5.7 | 12,693 |

## 19. Interpersonal Reactivity Index (IRI)

The Interpersonal Reactivity Index (IRI) is a measure of individual differences in empathy. Scales measuring empathy have been used in prior research to show how levels of empathy may change throughout medical education. For MSQ purposes, the IRI consists of two subscales - perspective taking and empathic concern - which each include 7 items. IRI scores are calculated by summing across 14 items, which are measured on a 0-4 point scale. The possible range of scores is 0 to 56 , and higher scores are correlated with higher levels of empathy. Only participants who responded to every item on the scale are included in the summary statistics. The mean IRI score, the standard deviation, and the number of respondents are displayed below. Additionally, a reliability estimate (Cronbach's alpha) is shown as a measure of internal consistency. The measure varies from 0 to 1 , and an instrument is often considered to be reliable if the estimate is 0.7 or higher.

| Interpersonal Reactivity Index (IRI) |  | Reliability Estimate | Mean | Standard Deviation | Count |
| :---: | :---: | :---: | :---: | :---: | :---: |
| All Medical Schools | 2017 | 0.8 | 42.7 | 6.6 | 12,287 |
| All Medical Schools | 2016 | 0.8 | 42.4 | 6.6 | 11,746 |
| All Medical Schools | 2015 | 0.8 | 42.2 | 6.6 | 12,210 |

## 20. Quality of Life (QOL) Scale

The Quality of Life (QOL) scale, which includes items from the Linear Analogue Self-Assessment Scale (LASA-6), is a measure of the following aspects of life: overall quality of life, mental (intellectual) well-being, physical well-being, emotional well-being, level of social activity, and spiritual well-being. The QOL questions ask about feelings during the last week. QOL scores are calculated by summing across the 6 items, which are measured on a $0-10$ point scale. The possible range of scores is 0 to 60 , and higher scores are correlated with higher quality of life. Only participants who responded to every item on the scale are included in the summary statistics. The mean QOL score, the standard deviation, and the number of respondents are displayed below. Additionally, a reliability estimate (Cronbach's alpha) is shown as a measure of internal consistency. The measure varies from 0 to 1 , and an instrument is often considered to be reliable if the estimate is 0.7 or higher.

| Quality of Life (QOL) Scale | Reliability | Standard <br> Estimate |  |  | Mean | Deviation |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| All Medical Schools | 2017 | 0.9 | 46.7 | 7.6 | 12,518 |  |
| All Medical Schools | 2016 | 0.9 | 46.8 | 7.4 | 11,970 |  |
| All Medical Schools | 2015 | 0.9 | 46.9 | 7.5 | 12,410 |  |

## Additional Quality of Life (QOL) Scales

Additional Quality of Life (QOL) items are also taken from the Linear Analogue Self-Assessment Scale (LASA) and are distinct measures of the following aspects of life: level of fatigue, level of social support from family and friends, and level of financial concerns. The QOL questions ask about feelings during the last week, and the scores are calculated individually on $0-10$ point scales. The possible range of scores is 0 to 10 , and higher scores represent more positive outcomes: no fatigue, higher levels of social support from family and friends, and no financial concerns. The summary statistics displayed below include the mean score, the standard deviation, and the number of respondents. Because the additional QOL items are calculated individually, the internal consistency estimate is not provided.

| 20a. QOL - Level of fatigue ( 0 = Constan |  |
| :--- | :---: |
| All Medical Schools | 2017 |
| All Medical Schools | 2016 |
| All Medical Schools | 2015 |

| Mean | Standard <br> Deviation | Count |
| :---: | :---: | ---: |
| 6.1 | 2.2 | 12,652 |
| 6.2 | 2.2 | 12,088 |
| 6.2 | 2.2 | 12,527 |

## 21. Perceived Stress Scale (PSS)

The Perceived Stress Scale (PSS) is a widely used instrument for measuring the perception of stress. The scale measures the degree to which situations in one's life are considered stressful. The scale also includes a number of direct questions about current levels of experienced stress. The questions in the PSS ask about feelings and thoughts during the last month. In each case, respondents are asked how often they felt a certain way. PSS scores are calculated by summing across 4 items, which are measured on a $0-4$ point scale. The possible range of scores is 0 to 16 , and higher scores are correlated with higher perceived levels of stress. Only participants who responded to every item on the scale are included in the summary statistics. The mean PSS score, the standard deviation, and the number of respondents are displayed below. Additionally, a reliability estimate (Cronbach's alpha) is shown as a measure of internal consistency. The measure varies from 0 to 1 , and an instrument is often considered to be reliable if the estimate is 0.7 or higher.

| Perceived Stress Scale (PSS) | Reliability |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| All Medical Schools | 2017 | 0.8 | 4.3 | Standard <br> Deviation | Count |
| All Medical Schools | 2016 | 0.8 | 4.3 | 2.5 | 12,489 |
| All Medical Schools | 2015 | 0.8 | 4.3 | 2.5 | 12,376 |

22. In thinking about a typical week during the two months BEFORE entering medical school, please provide the average number of hours PER DAY that you spent doing the following activities? Note: Responses needed to total 24 hours.

|  |  | All Medical Schools |  |  |
| :--- | :--- | ---: | ---: | ---: |
|  |  | $\mathbf{2 0 1 5}$ | $\mathbf{2 0 1 6}$ | $\mathbf{2 0 1 7}$ |
| Sleep | Mean | 7.7 | 7.7 | 7.7 |
| Educational activities (e.g., attending class, studying) | Standard Deviation | 1.1 | 1.1 | 1.1 |
| Non-educational activities (e.g., being with | Mean | 2.0 | 1.8 | 1.9 |
| friends/family, solitary recreation) | Standard Deviation | 3.1 | 3.0 | 3.0 |
| Paid work | Mean | 6.3 | 6.3 | 6.4 |
|  |  | 3.5 | 3.5 | 3.6 |
| Exercise/sports | Standard Deviation | 3.2 | 4.3 | 4.2 |
|  | Mean | 4.2 | 4.0 | 4.0 |
| Other | Standard Deviation | 4.0 |  |  |
| Number of respondents | Mean | 1.4 | 1.4 | 1.4 |
|  | Standard Deviation | 1.0 | 1.0 | 1.0 |

23. Have you been accepted to more than one medical school?

|  | Percent | $\frac{\text { Percent }}{}$ | $\frac{\text { Percent }}{}$ |
| :--- | ---: | ---: | ---: | ---: |
| Yes | 52.1 | 52.3 | 54.1 |
| No | 47.9 | 47.7 | 45.9 |
| Number of respondents | 12,482 | 12,055 | 12,622 |

24. In choosing the medical school you now (or will) attend, how important were the following factors? Note: Only those who responded "Yes" to Q23 could respond to this item.
