## PREFACE.

---

IN publishing the following Catalogue, the Medical Faculty of the University of Pennsylvania are actuated by the conviction, that some diffused memorial of the relation subsisting between the institution and those who have received its honours, is due alike to the school and its numerous alumni. It was their wish that the Catalogue should embrace the names of all the medical graduates, from the origin of the school to the present time, and that, in connexion with each name, should be indicated the place of residence of the individual referred to, the date of his graduation, and the subject of his inaugural essay. But as the records upon which they were compelled to rely for information are somewhat deficient, particularly those of an early period, the Catalogue is, in some respects, necessarily incomplete. It probably also contains errors, which can scarcely be avoided in a work of this kind, prepared from manuscript not always written with the greatest care. It is, nevertheless, believed to embrace the names of all or nearly all the graduates; and the Faculty hope, that such information may be furnished by persons concerned, as will enable them, should it be reprinted, to render it as perfect as the nature of the case will admit. A brief historical sketch of the school has been annexed, in the form of an Appendix, as an appropriate accompaniment to the list of graduates.

*July, 1836.*

## CATALOGUE.

The individuals whose names are marked with an asterisk (\*), in the following Catalogue, are those who took the degree of Bachelor of Medicine in the earlier periods of the School. When their names are succeeded by two dates, the latter date indicates the period at which they received the degree of Doctor of Medicine.

Upon those whose names are thus marked (+), the Honorary degree of Doctor of Medicine was conferred by the School.

NAMES.	RESIDENCE.	DATE.	SUBJECT OF ESSAY.
Abadie, Eugene H.	Pennsylvania,	1833	Epilepsy.
Abbett, Henry Jr.	Pennsylvania,	1825	Injuries of the Head.
Abbott, Robert	St. Croix,	1811	Cynanche Trachealis.
Abbott, Thomas H.	S. Carolina,	1834	Bilious Worm Fever.
Abercrombie, Charles	Pennsylvania,	1826	Fractures of the Fore-arm.
Abernethy, Augustine	Virginia,	1822	Cholera Infantum.
Abernethy, Hugh H.	Pennsylvania,	1830	Rupture of the Uterus.
Abernethy, Samuel	Pennsylvania,	1830	Traumatic Hemorrhage.
Adams, Joel R.	S. Carolina,	1829	Hemorrhoids.
Adams, Levin H.	Delaware,	1830	Catarrh.
Adams, Thomas J.	Virginia,	1826	Hæmoptysis.
Adams, William G.	S. Carolina,	1829	Chronic Dysentery.
Addison, Edward B.	Dist. of Col.	1815	Dysentery.
Addison, Samuel R.	Maryland,	1836	Functions of the Brain.
Agnew, James	New Jersey,	1800	Perspiration.
Aitken, Henry L.	Pennsylvania,	1828	Jaundice.
Alden, Ebenezer		1812	
Alexander, Ashton	Virginia,	1795	Influence of one Disease in the Cure of another.
Alexander, John Thomas	Louisiana,	1834	Capillary Circulation.
Alexander, Richard B.	Virginia,	1828	Juniperus Sabina and Junipe- rus Virginiana.
Alexander, William F.	Virginia,	1832	Arterial Circulation.
Alexander, William M.	Virginia,	1814	Sympathy.
Alexander, William S.	Virginia,	1811	Catamenia.
Alison, Hugh Lee	S. Carolina,	1819	Regular Gout.
Alison, Robert	Pennsylvania,	1819	Hypopion.
Allen, Abram Mawry	Virginia,	1830	Injuries of the Head.
Allen, Samuel A.	Virginia,	1834	Scarlatina.
Allen, Thomas		1812	
Allen, Thomas L.	Pennsylvania,	1813	Hydropic State of Fever.

NAMES.	RESIDENCE.	DATE.	SUBJECT OF ESSAY.
*Allison, Benjamin		1771	
Allison, John	N. Carolina,	1831	Peripneumonia.
Allison, Nathaniel S.	Pennsylvania,	1810	Pneumonia Vera.
Almy, Stephen O.	New York,	1832	Epidemic Ophthalmia.
Alston, William	S. Carolina,	1797	Dropsy, or the Hydropic State of Fever.
Amacker, Evans L.	S. Carolina,	1828	Cynanche Trachealis.

## APPENDIX.

### HISTORICAL SKETCH OF THE MEDICAL DEPARTMENT OF THE UNIVERSITY OF PENNSYLVANIA.

#### 1. *From the Origin of the School to its Division in 1789.*

The school which now bears the title of University of Pennsylvania, had been in existence, first as a simple ACADEMY and afterwards as a COLLEGE, for nearly sixteen years, before a system of medical instruction was admitted into its plan. This event may be considered as having taken place on the 3d of May 1765—the date at which the first medical professor was appointed. No school of medicine at that time existed in the country; and the College of Philadelphia undoubtedly deserves the credit of having opened this new path of liberal study in the American continent.

The idea of establishing a medical school in Philadelphia appears to have been first conceived by Dr. William Shippen and Dr. John Morgan. Some conversation upon the subject passed between these physicians while prosecuting their studies in Europe; but to which of the two the merit of priority in the conception belongs, has not been determined. Dr. Shippen, on his return from Europe, in the year 1762, commenced a course of Lectures on anatomy, in the introductory to which he expressed his belief in “the expediency and practicability of teaching medicine in all its branches” in the city of Philadelphia. He repeated this course privately for three successive years; but abstained from any further steps towards the accomplishment of his plan, till he should be joined by Dr. Morgan, who still remained in Europe. In the mean time, the latter gentleman had formed the project of engrafting a medical department on the College of Philadelphia, and had secured in its favour the opinions and recommendations of several influential friends of the institution residing in Great Britain. Among these may be mentioned Thomas Penn, the proprietary of Pennsylvania, and Mr. Hamilton and Mr. Peters, former presidents of the Board of Trustees of the College, from all of whom Dr. Morgan, on his return to America, brought letters to the Trustees, advising the establishment of medical professorships, and recommending the Doctor himself to their choice as one of the proposed Faculty. These letters, together with a written communication from Dr. Morgan, “setting forth his plan of opening medical schools under the patronage and government of the College, and intimating his desire to be appointed Professor of the Theory and Practice of Physic,” were laid before the board at a special meeting held on the 3d of May, 1765. The project appears to have met with the unanimous approval of the Trustees, who immediately took the first step towards its accomplishment by the appointment of Dr. Morgan to the office for which he had applied. At the collegiate commencement, which took place near the close of the same month, an address was delivered by the new professor, in which

the circumstances favourable to the establishment of the proposed school, and the advantages likely to accrue from it, were set forth with a clearness and force which must have strongly tended to conciliate public opinion in its favour. The following passage appears almost prophetic.

"Perhaps this medical institution, the first of its kind in America, though small in its beginning, may receive a constant accession of strength, and annually exert new vigour. It may collect a number of young persons, of more than ordinary abilities, and so improve their knowledge as to spread its reputation to distant parts. By sending those abroad duly qualified, or by exciting an emulation among men of parts and literature, it may give birth to other useful institutions of a similar nature, or occasional rise, by its example, to numerous societies of different kinds calculated to spread the light of knowledge through the whole American continent, wherever inhabited."

On the 23d of September of the same year, Dr. Morgan received a colleague by the unanimous appointment of Dr. Shippen to the Professorship of Anatomy and Surgery. The other chairs requisite to the formation of a complete Faculty, were for a time left unsupplied in consequence of the absence in Europe of the persons who were looked to as their ultimate occupants. In the mean while, the business of the school was commenced by the two professors already appointed. Their courses were announced by advertisement, that of Dr. Shippen to begin on the 14th, that of Dr. Morgan on the 18th of November, the former to embrace instruction in Anatomy, Surgery, and Midwifery, the latter to comprehend all the remaining medical sciences, but with a particular devotion to *Materia Medica*. Such was the humble commencement of a school, which can boast among its alumni of the thousands whose names are included in the catalogue now published.

The next step in the organization of the school, was the adoption, on the 12th of May, 1767, of a set of rules in relation to the medical honours to be conferred by the College. It was determined that there should be two degrees, those, namely, of *Bachelor of Medicine* and *Doctor of Medicine*, corresponding with the degrees of *Bachelor and Master of Arts* conferred in the other department. In relation to the lower degree, or that of *Bachelor of Medicine*, the following rules were adopted.

"1. Such students as have not taken a degree in the arts in any college, shall, before receiving a degree in physic, satisfy the trustees and professors of this college, of their knowledge in the Latin language, and such branches of Mathematics, Natural and Experimental Philosophy, as shall be judged requisite to a medical education.—2. Each student shall take at least one course in Anatomy, *Materia Medica*, Chemistry, Theory and Practice of Physic, and Clinical Lectures, and shall attend the practice of the Pennsylvania Hospital for one year; and may then be admitted to a public examination for a Bachelor's degree, provided that on a previous private examination by the medical trustees and professors, and such other trustees and professors as choose to attend, he shall be judged fit for a public examination, without attending any more courses in the medical school.—3. It is further required, that each student, previous to the Bachelor's degree, shall have served a sufficient apprenticeship to some reputable practitioner in Physic, and be able to make it appear that he has a general knowledge in Pharmacy."

The prerequisites for the degree of Doctor of Medicine were determined as follows.

"It is required for this degree, that at least three years shall have intervened, from the time of taking the Bachelor's degree, and that the candidate be full twenty-four years of age; who shall also write and defend a thesis publicly in College, unless he should be beyond seas, or so remote on the continent of America as not to be able to attend without manifest inconvenience; in which case, on sending a written thesis, such as shall be approved of by the college, the candidate may receive his Doctor's degree, and his thesis is to be printed and published at his own expense."

On the 26th of January, 1768, Dr. Adam Kuhn was appointed Professor of Materia Medica and Botany, and in the following May, Dr. Thomas Bond was elected to the chair of Clinical Medicine. Dr. Bond was one of the physicians of the Pennsylvania Hospital, and had already distinguished himself by clinical lectures delivered in that institution. The Introductory to his first course of Lectures in the Hospital, delivered on the 3d of December, 1766, has been preserved, and may be seen in the fourth volume of the North American Medical and Surgical Journal.

At the commencement of the College, held on the 21st of June, 1768, medical honours were conferred for the first time in America. The following gentlemen received the degree of Bachelor of Medicine on this occasion:—

JOHN ARCHER of Newcastle county, on the Delaware, BENJAMIN COWELL of Bucks county, Pennsylvania, SAMUEL DUFFIELD and JONATHAN POTTS of Philadelphia, JONATHAN ELMER of Cumberland county, New Jersey, HUMPHREY FULLERTON of Lancaster county, Pennsylvania, DAVID JACKSON of Chester county, Pennsylvania, JOHN LAWRENCE of East Jersey, JAMES TILTON of Kent county, on Delaware, and NICHOLAS WAY of Wilmington.

On the 1st of August, 1769, the organization of the college was completed, according to the original design, by the election of Dr. Benjamin Rush to the chair of chemistry. It may be proper to mention that Dr. Rush brought with him, on returning from Europe, a set of chemical apparatus, as a present for the College from the proprietary, Thomas Penn. This was deemed of so much importance, that the fact of the donation was made public in the advertisement announcing the commencement of the lectures.

During the winters of 1769-70, and 1770-71, annual courses of lectures were delivered by all the professors whose appointment has been mentioned, and in addition a course upon Natural Philosophy was given to the medical class by the Rev. Dr. Smith, Provost of the College; but after the latter date, we can find no notice of regular clinical lectures, and the chair of Clinical Medicine, on the death of Dr. Bond, which took place in 1784, remained vacant till united with the Institutes of Medicine.

No other material change occurred in the organization of the school or in the members of the Faculty, until the year 1789, if we except the appointment of William Bartram to a professorship of Botany in 1782, which, however, does not appear to have produced any practical result. We may, indeed, consider the school, from its first complete organization, to the period of its division in 1789, as consisting essentially of the four following professorships, filled as here stated:—

Professorships.	Professors.
1. Theory and Practice of Medicine,	DR. JOHN MORGAN;
2. Anatomy, Surgery, and Midwifery,	DR. WILLIAM SHIPPEN;
3. Materia Medica,	DR. ADAM KUHN;
4. Chemistry,	DR. BENJAMIN RUSH.

The following table presents a statement of the number of pupils who received the Bachelor's degree in each of the years from the date of the first medical commencement, to the period above alluded to.

Date.	Graduates.	Date.	Graduates.	Date.	Graduates.
A. D. 1768	10	A. D. 1780	3	A. D. 1785	9
1769	8	1781	2	1786	4
1770	1	1782	8	1787	5
1771	7	1783	4	1788	6
1773	2	1784	8	1789	3

It would appear, from the records of the school, that comparatively few of the graduates ever applied for the Doctor's degree. It is probable that the number of the pupils who attended the lectures was much larger than might now be inferred from the list of graduates, as the possession of a medical degree was at that time deemed much less essential to success in practice than at present, and many probably availed themselves of the opportunity of acquiring professional knowledge afforded by the lectures, who were indisposed to comply with all the conditions requisite for obtaining the honours of the institution. In fact we find it stated in the minutes of the Board of Trustees, that the number of medical students attending the lectures in the spring of 1779, was sixty, although no record has been kept of any graduations in that year, and it is probable that none took place.

The operations of the medical school were of course suspended during the occupation of Philadelphia by the British army in the war of the Revolution; and from the table above given it may be inferred that they languished throughout the whole period of the war.

A change which took place in the government of the College in the year 1779, has not hitherto been alluded to, because, though of a serious character, it had no material ultimate influence upon the medical department. By an unjust and unconstitutional act, the Legislature of Pennsylvania, in the month of September 1779, abrogated the charters granted to the Institution by the proprietors, removed the trustees, provost, vice-provost and professors from their offices, and transferred all the property to a new institution, which was endowed additionally out of the estates confiscated during the war, and received from its founders the title of *University of Pennsylvania*. As the medical professors lost their places by this act, though not aimed against them individually, it became necessary to organize the medical faculty anew in connexion with the University. Some difficulty was experienced in accomplishing this object. A succession of appointments and resignations took place for a period of more than three years; but in the autumn of 1783, the affair was finally arranged by the reinstatement of the former professors in the stations which they respectively held in the College.

## II. History of the School from 1789 to 1810.

In the year 1789 a new era may be said to have commenced in the history of the medical school. On the 6th of March, the Legislature, recognising the injustice of their predecessors, passed a law, by a great majority, reinstating the trustees and professors of the college in all their former estates and privileges—but still leaving the University in existence with the endowment which it had received out of the confiscated estates. Two institutions were thus established, under the titles respectively of the COLLEGE OF PHILADELPHIA and the UNIVERSITY OF PENNSYLVANIA, each having the privilege of connecting a medical school with its

other departments, and each unwilling to forego the exercise of that privilege in favour of the other. The consequence was the formation of two medical faculties, consisting partly of the members of the old faculty, partly of professors newly elected.

It is worthy of notice as a curious coincidence, that Dr. Morgan, the first professor in the school, and to be regarded as in some measure its founder, died at this period, before the new arrangements for the formation of the two faculties could be completed.

After the death of Dr. Morgan, only three of the old faculty remained, of whom Dr. Shippen retained a place in both schools, Dr. Kuhn continued in the University, and Dr. Rush joined the College. In the former school, the faculty was completed by the appointment of Dr. James Hutchinson, an active member of the Board of Trustees, to the united chairs of *Materia Medica* and Chemistry; in the latter, by the election of Dr. Samuel P. Griffitts to the professorship of *Materia Medica*, Dr. Caspar Wistar to that of Chemistry, which was now united with the Institutes of Medicine, and Dr. Benjamin S. Barton to a newly established professorship devoted to Botany and Natural History. The following synopsis will exhibit the organization of the two schools, as it was completed towards the close of the year 1789.

#### COLLEGE OF PHILADELPHIA.

##### Professorships.

1. Anatomy and Surgery,
2. Theory and Practice of Medicine,
3. *Materia Medica* and Pharmacy,
4. Chemistry and the Institutes of Medicine,
5. Botany and Natural History,

##### Professors.

- DR. WILLIAM SHIPPEN;  
DR. BENJAMIN RUSH;  
DR. SAMUEL P. GRIFFITTS;  
DR. CASPAR WISTAR;  
DR. BENJAMIN S. BARTON.

#### UNIVERSITY OF PENNSYLVANIA.

##### Professorships.

1. Anatomy and Surgery,
2. Theory and Practice of Medicine,
3. *Materia Medica* and Chemistry,

##### Professors.

- DR. WILLIAM SHIPPEN;  
DR. ADAM KUHN;  
DR. JAMES HUTCHINSON.

During the separate existence of the two schools, the University retained the former practice of conferring the preparatory degree of Bachelor of Medicine. This, however, was abandoned by the College, which conferred only the degree of Doctor of Medicine. The number of graduates was as follows:—

In the COLLEGE.		In the UNIVERSITY.	
Date.	Graduates.	Date.	Graduates.
A. D. 1790	5	A. D. 1790	12
1791	5	1791	1

The impolicy of attempting to sustain two schools in a place of which the patronage was not more than sufficient for the support of one, was too obvious to escape the notice of intelligent men; and we accordingly find that the idea of a union soon occurred to those interested in the different institutions. Nor was it long before so desirable an object was effected. The trustees of the College, having received an intimation that a disposition existed on the part of the trustees of the University to confer with them respecting a union of the interests of the two institutions, made a proposition to this effect to the latter body, by whom it was promptly accepted. Conferences accordingly took place, which resulted in an application to the legislature for the requisite alteration of the charters; and this

application was soon followed by a law uniting the two corporations into one. This event took place on the 30th of September, 1791, somewhat more than two years after the revival of the College. The united school took the name of University of Pennsylvania, which it has since retained.

Some difficulty existed in arranging the new Faculty; as it was necessary to include all the Professors of the two former Faculties, and at the same time to consult the qualifications and tastes of the several individuals concerned. The organization of the school was consequently, so far as related to the arrangement of the chairs, less in accordance with the condition of medical science at the time, than with the peculiar circumstances under which the institution was placed. The scheme adopted was obviously provisional, and only waited a change of circumstances to receive important modifications. Dr. Shippen retained the station he had held in both schools. Dr. Kuhn, as the next professor in point of seniority, was left in possession of the chair of the Theory and Practice, which he had held in the University; while Dr. Rush was provided for by a new professorship of the Institutes and Clinical Medicine. Dr. Wistar surrendered Chemistry to Dr. Hutchinson, and accepted the place of adjunct to Dr. Shippen, which was probably more in accordance with his taste. Little other change was necessary. The arrangement of the Faculty, when completed, was as follows:—

Professorships.

1. Anatomy, Surgery, and Midwifery,
2. Theory and Practice of Medicine,
3. Institutes of Medicine, and Clinical Medicine,
4. Chemistry,
5. Materia Medica,
6. Botany and Natural History,

Professors.

- DR. WILLIAM SHIPPEN, and  
 DR. CASPAR WISTAR, Adjunct;  
 DR. ADAM KUHN;  
 DR. BENJAMIN RUSH;  
 DR. JAMES HUTCHINSON;  
 DR. SAMUEL P. GRIFFITTS;  
 DR. BENJAMIN S. BARTON.

The appointments took place on the 23d of January, 1792. The last mentioned professorship was on a different footing from the others; as attendance upon the lectures was not essential to graduation. That the above plan was considered as in some measure provisional, is evinced by the fact, that, as soon as the opportunity was offered, the two professorships of the Theory and Practice, and of the Institutes and Clinical Medicine, and those of Materia Medica and of Botany and Natural History, were respectively united in one individual.

The degree of Bachelor of Medicine was now wholly discontinued, and that of Doctor of Medicine was the only honour henceforward conferred by the medical school. As prerequisites to graduation, it was determined—1. that the candidate should not be under twenty-one years of age, should have studied medicine for three years, and for two at least in connexion with the University; 2. that he should have attended at least one course of lectures of the several medical professors, with the exception of the Professor of Botany and Natural History, and should also have attended one course of Natural and Experimental Philosophy in the institution, unless he had received instruction in this branch elsewhere; and 3. that he should undergo a private examination before the Faculty, and, if approved by them, should be again privately examined by the Faculty in the presence of as many of the Trustees as might choose to attend, and finally, if found to be properly qualified, should offer a thesis, to be printed at his own expense, and defended in public at the annual medical commencement.

These provisions, though in some respects deficient, and in some unnecessarily burthensome, were sustained till the year 1807, when others were adopted,

which have been found better in practice, and, with a few alterations, still continue in force. The present regulations will be given in full in a subsequent part of this sketch.

No change in the Faculty took place till the year 1794, when the chair of Chemistry became vacant by the death of Dr. Hutchinson.

Dr. John Carson, a member of the Board of Trustees, was appointed in the place of Dr. Hutchinson, but died before he had an opportunity to officiate. On the 11th of November, the Board unanimously elected the celebrated Dr. Priestley, by whom, however, the appointment was declined. The chair was not finally filled till the 7th of July, 1795, when Dr. James Woodhouse was chosen Professor. In the mean time, the duties of the office appear to have been discharged by Dr. Barton.

In the year 1796, Dr. Griffiths resigned the chair of *Materia Medica*, and was succeeded by Dr. Barton, who now became entitled to all the privileges of the other members of the Faculty, which he had not enjoyed as Professor of Botany and Natural History.

Dr. Kuhn resigned his professorship of the Theory and Practice near the close of the year 1797, having been connected with the school nearly thirty years. Dr. Rush succeeded to his duties, although he does not appear to have been regularly appointed to the chair till 1805. At least we find it stated in the minutes of the Board of Trustees for June 5th, 1805, that Dr. Rush was on that day unanimously elected Professor of the Practice of Physic. As he continued to retain his former chair, the two professorships of the Practice and of the Institutes and Clinical Medicine, were consolidated into one.

A very important change in the organization of the school was made at this time, by the separation of Surgery from Anatomy and Midwifery, and its elevation to the dignity of a distinct professorship. This separation was obviously required by the nature and extent of the subjects, which were such that no one individual could possibly do full justice to them. It was fortunate also for the school, that it was enabled by the new arrangement to avail itself of the services of Dr. Philip Syng Physick, who was unanimously elected, on the 5th of June, 1805, to the newly established chair. The health, however, of Dr. Physick, was so feeble, that he found it necessary, in a short time, to apply to the Board of Trustees for the assistance of an adjunct, and Dr. John Syng Dorsey was accordingly appointed to this station.

The death of Dr. Shippen in the year 1808, left a vacancy, which was immediately supplied by the unanimous election of Dr. Wistar, his former adjunct, on whom the chief practical duties of the professorship had before devolved. Dr. Wistar, sensible that the subject of Anatomy was alone sufficiently ample to employ all his energies, and that the school would be benefited by making Midwifery the subject of a new professorship, proposed this change, in a letter read before the Trustees on the 3d of January 1809. The proposal, however, was not decided on by the Board till a year afterward. In the mean time, the professorship of Chemistry, left vacant by the death of Dr. Woodhouse, was supplied by the election of Dr. John Redman Coxe, who was at the time a member of the Board of Trustees. Dr. Coxe's election took place on the 10th of July, 1809.

On the 11th of April, 1810, the Board decided that the division of the chair of Anatomy and Midwifery was expedient, and accordingly made the latter the subject of a new professorship, to which Dr. Thomas C. James was elected on the 29th of the following June. It was, however, provided, that attendance upon the

lectures of the new professor should not be considered essential to the obtaining of the degree of doctor of medicine. At the same time, a professorship of Natural Philosophy in connexion with the medical school was instituted, and Dr. Robert Hare was chosen professor; but no lectures appear to have been delivered; and though subsequently, upon the resignation of Dr. Hare, the Board appointed Dr. Robert M. Patterson as his successor, the subject was found so slenderly connected with the wants of the medical student, that it could not take root in this department. The professorship was afterwards transferred to the department of natural science, and became prominent in its new position from the talents and popularity of its occupant.

The year 1810 may be considered as the close of the second period in the history of the school, a period which might be properly characterized as one of change and of progressive improvement. The first alteration was the division of the school in 1789; then came the reunion of the College and University, and the consequent expansion of the medical faculty towards the close of the year 1791; after this succeeded the concentration of the professorships as opportunity was offered by death or resignation; and finally the gradual expansion of the school upon the surer basis of the demands of medical science, until it attained its complete organization in the year 1810. The early changes were those of temporary expediency, and were attended with no striking effect in the enlargement of the class. Those which occurred at a later period were called for by a just consideration of the relative importance of the various branches of medicine, and were followed by a rapid increase in the prosperity of the school, till it attained that flourishing condition which marked the close of the above mentioned period, and which has continued with little permanent variation to the present date. The following table exhibits the annual number of graduates from 1792 to 1810, inclusive.

A. D.	Graduates.	A. D.	Graduates.	A. D.	Graduates.
1792	7	1799	8	1805	24
1793	10	1800	10	1806	21
1794	8	1801	10	1807	31
1795	4	1802	22	1808	60
1796	4	1803	15	1809	63
1797	15	1804	15	1810	65
1798	12				

The number of graduates, however, as before stated, cannot be taken as a just measure of the prosperity of the school; for it does not by any means bear the same relation to the number of students attending the lectures at different periods. The proportion of candidates for graduation to the number of matriculants, has been gradually increasing, from an early date in the history of the school to the present time. This result is owing partly to the increased value of a degree in the estimation of the community, which renders it more eagerly sought for; partly to the circumstance that students from other schools are now in the habit of resorting to this, in order to complete their medical education and to obtain its honours; and partly also to the removal of those embarrassments in the way of graduation, which, without affording a better test of the qualifications of the student for the practice of his profession, rendered the trouble of obtaining a degree greater, in the estimation of many, than its value. As a proof of the increasing proportion of graduates to students attending the lectures, it may be stated, that, in the year 1784, there were eight of the former to sixty of the latter, in 1790, in

both schools, seventeen to one hundred, in 1810, sixty-five to four hundred and six, and in 1831, when the number of graduates was greatest, one hundred and fifty-one to four hundred and ten.

### III. *History of the School from 1810 to 1835.*

From 1810 to 1835, the medical school may be considered as stationary in relation to its organization. The medical faculty, however, underwent during that period many changes in its members; and various interesting incidents occurred, which deserve notice even in so slight a sketch of the history of the school as that here offered. In 1810, the faculty was thus constituted:—

Professorships.	Professors.
1. Anatomy,	DR. CASPAR WISTAR;
2. Practice, Institutes, and Clinical Medicine,	DR. BENJAMIN RUSH;
3. Materia Medica,	DR. BENJAMIN S. BARTON;
4. Chemistry,	DR. JOHN REDMAN COXE;
5. Surgery,	DR. PHILIP SYNG PHYSICK;
	DR. JOHN SYNG DORSEY, Adjunct;
6. Midwifery,	DR. THOMAS C. JAMES.

In 1813, the University met with a great loss in the death of Dr. Rush, who was succeeded in his chair by Dr. Barton, elected on the 14th of July. On the 13th of August, Dr. Nathaniel Chapman, who had been associated with Dr. James in his lectures on Midwifery, was elected to the professorship of Materia Medica, rendered vacant by the resignation of Dr. Barton. In October, the professorship of Midwifery was placed upon the same footing as the other professorships, attendance upon the lectures being made necessary to graduation.

No further change took place till 1816, when the death of Dr. Barton left a vacancy, which was supplied by the appointment of Dr. Chapman to the chair of the Practice, Institutes, and Clinical Medicine. Dr. Dorsey was elected successor to Dr. Chapman in Materia Medica, on the 16th of April. In the same year, the professorship of Botany and Natural History, to which Dr. Barton had been originally elected, and which he had never relinquished, was formally abolished.

The year 1818 was very eventful to the medical faculty. In the month of January, Dr. Wistar was cut off in the midst of his course, and in the height of an almost unequalled popularity. During the remainder of the session his place was supplied by Dr. Dorsey, who was regularly appointed his successor in the following May. The chair of Materia Medica, which thus became vacant, was filled by the appointment of Dr. Coxe, who was succeeded in the chair of Chemistry by Dr. Robert Hare, elected on the 1st of September. Scarcely had the winter courses commenced, when the death of Dr. Dorsey rendered another choice necessary to the professorship of Anatomy. The Board of Trustees, however, were unable to act immediately in so unexpected an emergency; and the anatomical course was in the mean time conducted by Dr. Physick, who volunteered his services for this purpose.

In July, 1819, Dr. Physick was regularly elected Professor of Anatomy. The surgical chair, which was thus left unoccupied, was filled on the 7th of September by the election of Dr. William Gibson, at that time Professor of Surgery in the University of Maryland. The series of changes consequent upon the death of Dr. Wistar, was not completed till the 5th of December, 1820, when Dr. William E. Horner was elected Adjunct Professor of Anatomy.

The remaining changes up to the year 1835, may be stated in a few words. In 1825, the declining health of Dr. James rendering assistance necessary, Dr.

William P. Dewees was appointed Adjunct Professor of Midwifery. In 1827, Dr. Samuel Jackson, previously Professor of Materia Medica in the Philadelphia College of Pharmacy, entered the University as Assistant to the Professor of the Practice and Institutes. In 1831, Dr. Physick resigned the chair of Anatomy, and was succeeded by Dr. Horner, who was elected on the 1st of November. On retiring from the active duties of the school, Dr. Physick was appointed *Emeritus Professor of Surgery and Anatomy*. In 1834, Dr. James retired from the University on account of feeble health; and on the 7th of October Dr. Dewees was chosen Professor of Midwifery.

While these mutations in the Faculty were going on, various incidents occurred having a bearing upon the interests and usefulness of the school. Modifications of the rules in relation to graduation were adopted, of which the most important was the requisition of an attendance upon at least two courses of the various lectures, as essential to the obtaining of a degree. This was a salutary change; as any one familiar with the subject must be aware, that no ordinary capacity is adequate to the appreciation, and no ordinary memory to the recollection of a full course of medical instruction by attendance upon a single series of lectures on the different branches.

The foundation of that splendid anatomical collection denominated the WISTAR MUSEUM, was an event of no inconsiderable importance to the school. Dr. Wistar, during his long connexion with the professorship of Anatomy, had collected at much expense of money and labour, a great variety of models and preparations calculated to illustrate his lectures. After his death, these were secured to the school by the liberality of his widow; and measures were taken by the trustees to preserve and enlarge the collection by placing it in a suitable apartment, and by pecuniary appropriations. It received, in 1824, a valuable accession in the collection formerly belonging to the Pennsylvania Hospital, which was presented by the managers of that institution. Much of its present flourishing condition is also to be ascribed to the indefatigable exertions of the gentleman who now occupies the chair of Anatomy. The museum will be more particularly noticed in an account of the existing condition of the school with which this brief narrative will close.

In the year 1821, an attempt was made to introduce instruction in pharmacy, in its relations to the art of the apothecary, into the scheme of the medical school. The trustees accordingly instituted the degree of *Master of Pharmacy*, to be conferred upon such apothecaries as might be deemed most worthy of it, and afterwards upon all persons intending to become apothecaries, who should have served a regular apprenticeship of at least three years, should have attended two courses of lectures on Chemistry and on Materia Medica and Pharmacy in the University, should have sustained a good moral character, and should be able to furnish to the Board the requisite evidence of their qualification after an examination by the professors of the branches above mentioned. This movement upon the part of the University was called for by the very imperfect state of the pharmaceutical art at that time in the United States, and was followed, though not exactly in the mode anticipated, by the most happy results. A spirit was excited among the apothecaries themselves, which led to the establishment of a college in Philadelphia, devoted to the improvement of their profession. By this College a school was instituted, which has now been in existence many years, and has exerted a most beneficial influence not only over the pharmacy of Philadelphia, but indirectly also over that of the whole Union.

Another event worthy of notice took place about the same time. On the 4th

of December, 1821, a letter from the Faculty was received by the Board, proposing to establish, under the management of the trustees, a foundation for the gratuitous education of six medical students. The trustees accepted the offer, and, in the following April, adopted a set of rules in relation to the subject. A committee of three members of the Board was appointed, whose office was annually to give due notice that applications for gratuitous admission to the lectures would be received, and to examine and determine upon the applications which might be made. The only qualifications demanded of the student were, that he should be of good moral character, in restricted circumstances, eighteen years of age, of studious habits, and possessed of sufficient literary acquirements. These regulations have continued in force to the present time; and as each appointment continues for two years, twelve individuals, whose exertions might otherwise have been repressed by their deficient means, have annually enjoyed the benefits of the foundation.

The erection of the hall occupied by the medical professors is an event which also merits notice. The lectures were originally delivered in the small building now in the possession of the Board of Health, in Fifth, between Chestnut and Walnut streets; and the public exhibitions of the school took place in the old Academy, in Fourth, near Mulberry street, in which the department of Arts was formerly accommodated. After the purchase, in 1800, by the Trustees of the University, of the edifice in Ninth street originally intended as a residence for the President of the United States, an addition was made for the accommodation of the medical school, which was completed about the year 1807. This was occupied by the Professors until the year 1829, when the Trustees determined to remove the old buildings entirely, and to substitute for them others better adapted to the purposes of the institution. The present hall was commenced in March 1829, and completed in October; so that the lectures underwent no interruption.

The success of the school, so far as concerns the number of pupils, has not permanently varied since the year 1810. Different causes have tended to augment the class in one year and to diminish it in another; but on the whole the fact is as just stated. This may be seen from an examination of the following table, which exhibits the number of students who attended the lectures, together with the number of graduates, in each year, from the winter of 1810-11, to that of 1835-36 inclusive.

A. D.	Matriculants.	Graduates.	A. D.	Matriculants.	Graduates.
1810-11.	406	65	1823-24.	424	96
1811-12.	387	70	1824-25.	487	111
1812-13.	349	61	1825-26.	440	114
1813-14.	345	62	1826-27.	441	131
1814-15.	319	44	1827-28.	409	133
1815-16.	388	70	1828-29.	362	109
1816-17.	436	74	1829-30.	421	127
1817-18.	465	87	1830-31.	410	151
1818-19.	422	102	1831-32.	386	134
1819-20.	330	78	1832-33.	367	117
1820-21.	325	66	1833-34.	432	145
1821-22.	357	77	1834-35.	390	135
1822-23.	455	101	1835-36.	398	132

The average annual number of matriculants, as presented by this table, is three hundred and ninety-eight, which, by a singular coincidence, is precisely the number of the last class.

IV. *Change in the School in 1835, and present Condition.*

To complete our view of the Medical School, it remains only to mention the change in the organization and composition of the Faculty which took place in the year 1835, and then to give a short sketch of the present condition of the department.

It is well known to all those interested in the University of Pennsylvania, that the chair of *Materia Medica* became vacant in the early part of this year. An opportunity was thus offered to the Trustees to extend the organization and augment the efficiency of the Faculty, without either interfering with the rights of the existing Professors, or increasing the expense of the pupil. That the subjects of the Practice and Institutes of Medicine, which had for many years been combined, were together too copious for the time and powers of one professor, was obvious to all who were acquainted with their great importance, and with the vast extension recently given to the single science of Pathology. The necessity of their separation had, indeed, been recognised in the appointment of an assistant to the Professor who occupied the united chairs. This appointment, however, was merely provisional. To give their due relative weight to the two branches, and to secure permanently adequate instruction in each, it was necessary to establish a new professorship. The Trustees accordingly decided that the Institutes of Medicine should form the ground of a distinct chair, the occupant of which should be compensated, for the present, by one half the amount of the fee before received by the Professor of *Materia Medica*, while the remaining half should belong to the person who might be newly chosen to the latter chair. This arrangement secured additional instruction to the class, without injury to the older members of the Faculty, or increased expense to the student, and could not be objected to by those who entered the University under its provisions; especially as the chairs were in all respects except in compensation, placed upon a footing with the other professorships, and even in this respect the difference was understood to be temporary. The election to fill the two chairs took place on the 6th of October, when Dr. Samuel Jackson was chosen Professor of the Institutes of Medicine, and Dr. George B. Wood, Professor of *Materia Medica* and Pharmacy. On the 14th of the following November, Dr. Hugh L. Hodge was elected Professor of Midwifery, in the place of Dr. Dewees, who resigned on account of feeble health.

At this time (June, 1836) the Faculty consists of seven professors, independently of Dr. Physick, who holds the station of *Emeritus Professor of Surgery and Anatomy*, but does not officiate. They are,

NATHANIEL CHAPMAN, M. D., Professor of the Theory and Practice of Medicine;

ROBERT HARE, M. D., Professor of Chemistry;

WILLIAM GIBSON, M. D., Professor of Surgery;

WILLIAM E. HORNER, M. D., Professor of Anatomy;

SAMUEL JACKSON, M. D., Professor of the Institutes of Medicine;

GEORGE B. WOOD, M. D., Professor of *Materia Medica* and Pharmacy;

HUGH L. HODGE, M. D., Professor of Midwifery, and of the Diseases of Women and Children.

WILLIAM E. HORNER, M. D., is the Dean of the Faculty.

Courses of Lectures are delivered by each of the Professors upon the branches of Medicine respectively attached to their chairs. These courses have hitherto occupied only four months; but in consequence of the number of lectures which

the shortness of the session renders it necessary to crowd into each day, the student is subjected to more fatigue than is compatible either with his comfort or the most profitable exercise of his faculties. By the addition of a month to the session, this disadvantage would be entirely removed; and opportunity would also be given for some expansion of those courses which are now most restricted. The Faculty, accordingly, have such an extension in contemplation; and, should it be found consistent, in other respects, with the interests of the Pupil and the Institution, they hope to be able to carry it into effect in the next session.

It may be proper to inform the medical community, that the aim of the Faculty is to render their courses as demonstrative as possible, so as to bring the senses of the pupil to the aid of his memory and intelligence. For this purpose, ample means of illustration are at the command of the Professors.

The ANATOMICAL MUSEUM, to which allusion has been already made, occupies an apartment in the Medical Hall fifty feet square, with a gallery on three sides which increases its capacity. It is well lighted, and is open to the medical class two mornings in the week. It is abundantly furnished with preparations of every kind calculated to give the fullest illustration of a course of Anatomical lectures. Its leading classes of objects are *dried arterial and venous injections, magnified drawings and models, the best Anatomical plates*, a great variety of *wet preparations*, exhibiting organs in their healthy and diseased states, and an ample series of *minute injections* for the purpose of illustrating ultimate structure, such as are not to be found elsewhere in this country, and many of them peculiar to this school. Among the most interesting objects of the cabinet is a group of preparations exhibiting the morbid changes produced in the alimentary canal by malignant cholera, from their first manifestation in a lining of coagulable lymph, to the complete destruction of the mucous coat of the stomach and colon. Interesting points of minute anatomy, such as the globules of the blood, ultimate fibres, the structure of glands, the communication of the air vesicles of the lungs, the villi and follicles of the intestinal canal, and the papillæ of the skin, are exhibited, during the course of lectures, with the aid of the most improved microscopes, as the Lucernal, Solar, Martin's single and compound, Raspail's, Woollaston's doublet, Amici's reflecting microscope, &c.

The SURGICAL CABINET is also richly supplied with the means of illustration. The present professor has been diligently employed, for nearly thirty years, and at an expense exceeding twenty thousand dollars, in collecting *wet and dried specimens of morbid and surgical anatomy; highly finished oil pictures upon a magnified scale*, representing almost every variety of surgical disease; *accurate coloured models and casts in wax of natural and morbid anatomy; machinery and various forms of apparatus* for fractures, dislocations, spinal diseases, &c.; *instruments* of the most costly description, ancient and modern, manufactured by the best British, French, and American artists; all of which are made subservient to the illustration of his lectures, which are throughout demonstrative and practical. The greater portion of the morbid collection has been derived from the extensive opportunities afforded the professor by his long connexion with hospitals, and other public institutions, in this city and elsewhere. Upon the whole, it may be confidently stated, that no surgical cabinet in the United States, either public or private, and few in Europe, are comparable with that belonging to Dr. Gibson, and attached to the University of Pennsylvania.

The CHEMICAL APPARATUS is, by the admission of all who have inspected it, unequalled in extent, variety, and splendour. Individuals who have visited the

schools of Germany, France, and Great Britain, agree in the statement, that they have no where met with a laboratory so amply furnished with all that is calculated to illustrate the science of chemistry as that of Dr. Hare. Some idea may be formed of its extent, and at the same time of the liberality which presides over the experimental course of chemistry in this school, from the fact that the expenditures of the professor, connected with his lectures, have amounted, on an average, to fifteen hundred dollars annually from the period of his election to the chair, in the year 1818.

The Professor of Midwifery has occupied his chair for too short a period to have been able to provide so full an illustrative cabinet as he could desire. Already, however, he has procured numerous paintings in oil, exhibiting, on a large scale, the structure and processes connected with his branch; and it is his intention to spare no expense in illustrating the principles and practice of Midwifery, and the nature of the diseases of women and children, by actual demonstration, whenever possible, and by means of diagrams, models, machines, instruments, and well executed paintings.

The illustrations of *Materia Medica* consist of painted figures of all the medicinal plants, dried specimens of such as are indigenous or naturalized in this country, and specimens, upon a large scale, of all the medicines treated of in the lectures, not only in the ordinary forms in which they are employed, but also in their crude condition, their commercial varieties, and their different states of preparation. Occasion is taken, throughout the course, to exhibit, as far as possible, every fact of the science to the eye, and to render *Materia Medica*, what it has not hitherto been usually considered, a demonstrative subject.

The Medical Hall is admirably adapted for the purposes of the school. Its central situation in the city gives to the pupil an opportunity of selecting his place of residence wherever circumstances may render it desirable, without being at too great a distance from the place of instruction. The ample space around it allows of that free circulation of air which is especially necessary, in an establishment of this kind, to comfort and the preservation of health. Its dimensions and external architectural character, are such as not to appear incongruous with the extent of the school, and the high objects for which it was established. Its internal arrangements are all that could be desired. Besides distinct apartments for the various cabinets, and ample space for the prosecution of practical anatomy, there are three lecture rooms, each calculated for the comfortable accommodation of six hundred pupils. One of these rooms is devoted exclusively to chemistry, and in its extent and arrangements as a laboratory is nowhere surpassed. A second is appropriated to the other demonstrative branches, and was built under the immediate superintendence of the Professor of Anatomy, whose subject most requires all the extraneous aid which can be afforded by light and the proximity of the pupil. It is sixty feet square, with the seats circularly arranged about a central area, in which the demonstrations are made, and which is lighted from the roof immediately above it. The seats rise by a paraboloid ascent, so graduated as to allow the students in each row to see over the heads of those in the row beneath. The third room is appropriated to those departments of our science which do not require the aid of demonstration. The lectures of the different professors are so arranged in regard to time, that the student never remains in the same room two hours successively, but after every lecture passes into another apartment. He is thus enabled to escape the irksomeness of remaining very long in the same position, and gains the advantage of some exercise in the intervals between the lectures.

Nor is the plan of instruction confined exclusively within the Medical Hall. Clinical instruction in the different hospitals has always formed a part of medical education in this school; but it is only within a few years that the present system has been adopted, by which large classes can be instructed by the bedside. Formerly, the pupil walked through the different wards of the hospitals with the physician, and listened to his desultory observations as the patients came successively under his notice. This plan answers well enough where the number of pupils is small, not exceeding from ten to twenty; but is obviously altogether unsuited to large classes consisting of some hundreds. Sensible of its utter futility as regards the instruction of the pupil, and of its injury as regards the patient, the professors of the Practice, Surgery, and the Institutes, in this school, introduced some years since into the Alms House Hospital the plan of having the patient brought on his bed into the centre of a lecture room fitted up for the purpose, and there making their clinical remarks within the view and hearing of the whole class. In surgical cases the opportunity is thus also afforded of performing whatever operations may be necessary in the presence of the class, who were formerly only called together into the operating room to witness operations deemed peculiarly interesting. Since the erection of the new Alms House, the medical department of which is now called the Philadelphia Hospital—the largest and most magnificent establishment of this kind upon the continent of America, and probably unsurpassed if equalled elsewhere—the system has been improved and extended, and clinical medical and surgical lectures are regularly delivered during the winter by the Professors of the Institutes and Surgery. The same system has been carried into operation, during the last winter, in the Pennsylvania Hospital, by gentlemen every way competent to the undertaking; and thus the pupil has the benefit of a choice between two institutions, each having its peculiar advantages. It would not be proper to pass over unnoticed a feature in clinical instruction as conducted in the Philadelphia Hospital, entirely new in this country. Allusion is had to the demonstrations of pathological anatomy, which are abundantly made by the physicians of the house in their clinical lectures, and which are of great importance to the student desirous of obtaining a thorough insight into the seat and nature of disease.

The following are the regulations at present in force in relation to the degree of Doctor of Medicine in the University.

1. Every candidate for this degree must have attained the age of twenty-one years—applied himself to the study of Medicine for three years—and been during that time the private pupil, for two years at least, of a respectable practitioner of medicine.

2. The candidate must have attended two complete courses of the following lectures in this Institution:—

Anatomy,  
Practice of Physic,  
Materia Medica and Pharmacy,  
Chemistry,  
Surgery,  
Midwifery and the Diseases of Women and Children, and  
Institutes of Medicine.

He must also have attended one course of Clinical Instruction in the Philadelphia Hospital (*Blockley*), or the Pennsylvania Hospital, or some other institution approved of by the Faculty of Medicine.

3. Medical Students who have attended one complete course in a respectable Medical School, where the attendance on two complete courses is necessary for a degree, where the same branches are taught as in this, and which is placed upon the *ad Eundem* of this school, are permitted to become candidates by attending here for one full course only, and have the same privileges with students who have attended this school twice.

4. Preparatory to obtaining any tickets, the student must matriculate, by having his name registered by the Dean of the Medical Faculty.

5. When the candidates for a Medical Degree apply to the Dean for admission as such, they must exhibit their tickets to prove that the regulations have been complied with.

6. Each candidate, at the time of his application, must deliver to the Dean of the Medical Faculty, at least one week before his examination, and on or before the 10th of March, a Thesis composed by himself, on some medical subject, and to be approved of by the Professors. This Thesis is referred to one of the Professors, who shall examine the candidate upon it, in the presence of the Medical Professors, and such of the Trustees as choose to attend.

7. When a candidate is rejected, his essay will be retained by the Medical Faculty.

8. When candidates withdraw their essays for any purpose whatever, they, upon re-application, will be placed at the foot of the list.

9. The Essay must be in the candidate's own hand-writing, and must be written uniformly on paper of the same size, the alternate pages being left blank. General bad spelling in a Thesis, or general inattention to the rules of grammar, precludes a candidate from examination for a degree.

10. All questions on the admissibility of a Thesis, shall be determined some time previously to the day fixed for the examination of the candidate who may have presented it.

11. A Thesis may be published by the candidate if he desire it, the permission of the Professor by whom he was examined thereon being first obtained, but no alteration shall be made therein after such permission is given.

12. The voting on the case of each candidate is by private ballot, and three negative votes reject him.

13. Each candidate shall pay to the Dean of the Faculty the fees of graduation, at the time of his examination.

14. Candidates who have passed their examination, and in other respects complied with the regulations, must be reported by the Dean to the Provost, who in turn will communicate such report to the Board of Trustees, in order that if approved of by them, their mandamus be issued for conferring the degree at such time as they may think expedient.

15. The Degree will not be conferred upon a candidate who absents himself from the public commencement, except by special permission of the Medical Faculty.

16. Graduates of medical schools, on the *ad Eundem* list, by attending one complete course in this institution, are put upon the same footing with students who have attended two complete courses here.

July 1836.

FINIS.
